Skin Tear Pathway

NHS Forth Valley

PATIENT PRESENTS WITH SKIN TEAR

Control the bleeding Apply pressure/elevate the limb Cleanse the wound as per local protocol Classify (measure and document)

- ------

TYPE 1 - NO TISSUE LOSS

Linear flap or tear where the skin flap can be repositioned over the wound bed.

TYPE 2 - PARTIAL FLAP LOSS

The skin flap cannot be repositioned to cover the whole of the wound bed.

TYPE 3 - TOTAL FLAP LOSS

Total skin flap loss that exposes the entire wound bed.

Approximate the wound edge if skin is viable, ease the skin flap into position

Set treatment goals

- Treat the cause
- Implement prevention protocol
- Moist wound healing
- Avoid trauma
- Protect peri-wound skin
- •Manage exudate
- Avoid infection
- Pain control

Review and re-assess

Monitor the wound for any changes and revise treatment plan according to progress

Document findings and record as per local protocol

Kliniderm Foam Silicone Border Dressing 7.5cm x 7.5cm	2	394-7231	216659
Kliniderm Foam Silicone Border Dressing 10cm x 10cm	2	394-7249	216666

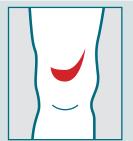

5 STEPS

- 1. Wash your hands before beginning treatment of the skin tear. Check you have the correct equipment (see box contents check list). Gloves should be worn when treating the skin tear.
- 2. Measure the skin tear and type and record in patients notes. Clean the wound using saline. Apply moist swab to wound and soak for five minutes.
- 3. Remove moist swab and, if necessary, ease the edges of the skin tear together. **DO NOT USE closure strips e.g. steristrips to approximate wound edges.**
- 4. Remove both covers of the Kliniderm foam silicone border dressing and place over the wound. Draw an arrow and date on top of the Kliniderm to indicate the direction of removal (see Fig1 below). Apply ensuring the edges of the skin tear stay in place. Inform nursing staff of skin tear if you have administered first aid. If a larger dressing is required, please liaise with local wound advocate / District Nurse.

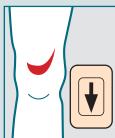

Leave dressing in place depending on skin tear type: **Type 1** - 7 Days | **Type 2** - 3 days | **Type 3** - 24hr

5. Only change the dressing if exudate/blood is not being contained or signs of infection are evident. Remove the dressing in the direction of the arrow, as demonstrated below. If healing has not occurred in seven days, or if the areas appear red, hot and inflamed advice may need to be sought.

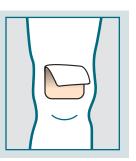

Skin flap rolled downwards to cover wound

Arrow down on dressing

Dressing applied with arrow to indicate direction of removal

Remove in direction of arrow
